

INDEPENDENT CANDIDATE MATERIALS · MANAGER DATA
PRODUCTS

Turn analytics demand into adopted decisions.

A candidate point of view on the real mandate, operating tensions, and lightweight system required to translate BI, data, automation, and AI investment into business outcomes.

Actual mandate: Turn fragmented analytics demand into a deliberately governed portfolio of decision products that get prioritized, released, used, and improved—without importing heavyweight product process.

Why the role exists now

- ARMADA's public identity increasingly joins data, AI, visibility, operations, and action.
- The 2026 integration of ARMADA, Sunset Transportation, and ATEC Logistics raises the value of shared definitions, visibility, prioritization, and reusable products.
- The posting explicitly calls for stronger opinions, fewer surprises, lower rework, and adoption ownership.

Central contradiction

The company wants product judgment without product bureaucracy: enough structure to make tradeoffs, release safely, and learn—but not so much ceremony that the team spends more time feeding the system than delivering value.

Operating tensions

- Urgency vs enterprise value
- Stakeholder service vs constructive refusal
- Speed vs data quality and access
- Output delivery vs behavior adoption
- Current Microsoft stack vs future platform evolution

Stakeholder topology

Business decision owners · BI · Data Engineering · analytics users · platform/security/access owners · executive sponsors · workflow operators · change champions · support and governance partners.

COMPANY MOMENT: DOCUMENTED SIGNALS AND DISCOVERY HYPOTHESIS

Publicly documented	Hypothesis to test in discovery
ARMADA publicly describes an orchestrated supply chain powered by data, AI, visibility, and action.	Internal analytics demand may carry similar orchestration challenges: multiple sources, varied urgency, unclear destinations, and handoff risk.
ARMADA, Sunset Transportation, and ATEC Logistics are integrating under one brand in 2026.	The integration may create high-value opportunities for shared definitions, executive visibility, reusable datasets, and cross-functional data products.

The Outcome Cross-Dock

Every request should carry an intended decision, destination, release contract, and adoption receipt.

1 • Name the decision
What recurring decision or behavior should change? Who makes it?

2 • Stage the load
Value, urgency, effort, readiness, owner strength, adoption burden.

3 • Route the work
Build now • Shape next • Explore • Stop/Hold—with rationale.

4 • Clear the release
Quality, validation, access, usability, failure handling, ownership.

5 • Receive the outcome
Use, decision impact, friction, learning, reuse, revision, retirement.

Minimum intake contract

- Business decision and user
- Problem/consequence
- Value and urgency
- Current workaround or baseline
- Named decision owner
- Data/source condition
- Adoption path
- Evidence after release

Disposition logic

- **Build now:** high-value decision, sufficient readiness, accountable owner.
- **Shape next:** promising work requiring clearer scope, data, or ownership.
- **Explore:** uncertain solution or AI/automation fit that needs bounded evidence.
- **Stop/Hold:** no accountable decision, weak value, duplication, or unacceptable risk.

Release contract

Data quality • validation • access • usability • support ownership • exception handling • security/governance • training • launch communication • measurement instrumentation.

Adoption receipt

Who used it? In which workflow? What decision changed? What friction remains? What should be standardized, scaled, revised, supported differently, or retired?

BALANCED SCORECARD

Decision value	Delivery flow	Trust / release	Adoption	Learning
Decision and owner clarity; credible consequence; portfolio relevance.	Qualified-to-start time; blocker age; scope-decision speed.	Quality, validation, access, usability, failure readiness.	Intended use; retained behavior; user friction; support demand.	Reuse, revision, retirement, standards, feedback-to-change time.

Measurement categories are proposed. Targets require ARMADA baselines and are not asserted here.

Why Russell, where the gap is, and how to test it.

Verified evidence map

- **Vape-Jet:** current cross-functional AI-first operating transformation, systems, signals, priorities, dashboards, handoffs, training, accountability.
- **DudeWorth:** value/feasibility/readiness/governance/adoption frameworks; agentic workflows; human authority; evaluation.
- **Amazon:** scaled decision cadence, throughput visibility, launch, escalation, Lean/Gemba.
- **Compunetics:** engineering-business translation, quality systems, process controls, high-reliability execution.

Strongest reasonable objection

Russell does not claim ownership of a production Microsoft Fabric estate or deep Power BI tenure.

Response: the role's differentiator is not dashboard authorship alone. It is product judgment, stakeholder translation, delivery momentum, release discipline, adoption, and value realization. Validate platform fit through one bounded workstream immediately.

First proof point

Select one active Power BI/Fabric workstream with a real owner, visible blocker, meaningful release risk, and measurable adoption path. Use it to prove translation, platform ramp, release readiness, stakeholder communication, and post-launch ownership.

Change burden

Business owners must name the decision and own adoption. BI/ Data Engineering must surface tradeoffs and release constraints early. Users must return friction. Leadership must support explicit priorities and visible “not now” decisions.

EXECUTIVE QUESTIONS

1. Which recurring decisions are most constrained by data or analytics friction?	2. Where does work stall most often: qualification, engineering, validation, access, usability, or adoption?
3. How is “used and valuable” distinguished from “delivered” today?	4. Which enterprise-integration decisions most need shared data products?
5. What does the team need this role to stop doing—not only start doing?	6. What would prove, within 90 days, that the operating model is helping rather than adding ceremony?

Candidate thesis: ARMADA's external promise is intelligence that acts. The internal data-product portfolio should be managed toward the same outcome: a trusted decision, an accountable user, and evidence that the product changed the work.
