

One-page decision-product review

Use before committing significant delivery effort and again after release. The artifact is intentionally small: every field must change a decision, clarify a handoff, or preserve learning.

NAME THE DECISION
Decision / user
Current friction
Consequence
Owner

STAGE THE LOAD
Value / urgency
Effort / dependencies
Data readiness
Adoption burden

ROUTE THE WORK
Build now
Shape next
Explore
Stop / Hold

CLEAR RELEASE
Quality / validation
Access / usability
Failure / support
Human authority

RECEIVE OUTCOME
Use / behavior
Decision impact
Friction
Next disposition

Field	Review prompt	Evidence / decision
Decision product	What recurring business decision or behavior will this report, dataset, automation, or AI-assisted solution improve?	
Accountable owner	Who owns the decision and adoption—not merely the request?	
Value and urgency	What credible consequence exists today? What makes this more important than competing work?	
Readiness	What is known about sources, definitions, lineage, quality, access, dependencies, and technical feasibility?	
Disposition	Build now, shape next, explore, or stop/hold? Why?	
Release contract	What must be true for quality, validation, access, usability, support, failure handling, security/governance, and human authority?	
Adoption mechanism	Where will the product enter the workflow? What behavior changes? Who reinforces it?	
Outcome evidence	What will be observed after release—use, decision behavior, cycle time, rework, quality, support, exceptions, or another relevant measure?	
Learning disposition	Scale, standardize, reuse, revise, support differently, preserve as exception, hold, or retire?	

Review test: if the team cannot name the decision owner, release conditions, and evidence after launch, the item is not ready to be treated as a committed data product.

Illustrative candidate artifact. It does not represent ARMADA's current process or internal data.
