

OUTCOME ROUTING REVIEW

Use this one-page review to turn a vague request into an explicit product decision. Values and examples must be established with ARMADA; the sample row below is illustrative.

Field	Question	Illustrative example
Problem / decision	What decision or workflow needs to improve?	Leaders need one trusted view of service exceptions requiring cross-functional action.
Owner / users	Who owns the outcome, and who will use the product?	Named business owner; operations and commercial leaders as repeat users.
Business consequence	What happens if the problem remains unresolved?	Slower intervention, repeated reconciliation, inconsistent escalation.
Evidence readiness	Are definitions, sources, quality, access, and validation sufficient?	Definitions aligned; two source-quality exceptions require bounded validation.
Delivery path	What is the smallest responsible product and dependency set?	Initial Power BI view using governed semantic model; no AI feature in first release.
Release readiness	How will quality, usability, access, ownership, and support be verified?	User validation, access test, exception review, owner signoff, support handoff.
Adoption mechanism	What behavior changes, and who reinforces it?	Weekly operating review uses the product as the source for exception decisions.
Outcome evidence	Which unit and baseline will be used?	Decision latency and reconciliation effort, baselined before release.
Disposition	Build, Validate, Sequence, or Stop - and why?	VALIDATE: prove the two source exceptions and user workflow before broad build.
Next review	Who decides what happens next, and when?	Business owner + product + BI lead after bounded validation.

DISPOSITION RULES

Build: sufficient outcome, evidence, delivery, and adoption ownership. **Validate:** one critical assumption needs proof. **Sequence:** dependency or capacity must be resolved first. **Stop:** unclear decision or insufficient value.
